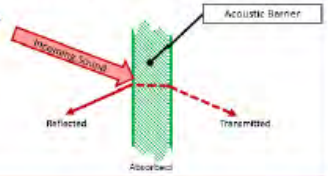
Objective

To design, research, and fabricate a novel low-cost tabletop anechoic chamber for acoustic absorption characterization of composite devices.



Purpose

Testing of devices' resonant frequencies is often necessary in the aerospace industry to keep vibrations from escalating to dangerous levels through constructive interference. When small devices are designed, it is often a big inconvenience to take them to an anechoic room for testing. Instead of traveling with the newly designed device for testing, a tabletop anechoic chamber allows for cost effective testing within the lab.
